- How to Use Accounting Ratios in Your Business?

While the thought of calculating ratios may be intimidating to some, even if you're not a CPA, accounting ratios can provide you with important information about your business.

These ratios, also known as financial ratios, can be used to measure cash flow, predict profit, and find out how quickly your customers pay you.

What Are Accounting Ratios?

Accounting ratios are calculations that are used to compare results from period to period, or between similar companies.

Numbers used in financial ratios are usually found through analysis of your company's financial statements, such as your balance sheet and income statement, and in most cases, the formulas for calculating the ratios are simple.

While useful for internal purposes, accounting ratio metrics are also used by creditors and potential investors to gain better insight into the financial health of a business.

Common Ratio Categories

There are numerous accounting or financial ratio categories available to choose from. Below are just a few of the more common ratios that any size business can use. Individual ratios can be grouped in multiple categories as there is overlap in the categorization.

• Profitability Ratios

Profitability ratios, also known as performance ratios, are easy to calculate and are used to measure company profitability and expense management.

Gross profit ratio, net profit ratio, variable expense ratio, operational efficiency ratio, cash flow to sales ratio, and return on investment are some of the more common profitability ratios.

▪ Activity Ratios

An activity ratio, also known as an efficiency ratio, is used to determine how efficiently a business uses its assets to generate revenues and manages its liabilities. The asset turnover ratio, accounts receivables turnover ratio, and working capital turnover ratio are all activity ratios.

▪ Liquidity Ratios

Liquidity ratios are used to measure a company's ability to pay its current debt without additional capital and are used frequently with solvency ratios. Common liquidity ratios include quick ratio, current ratio, net working capital ratio, and days sales outstanding ratio.

▪ Leverage Ratios

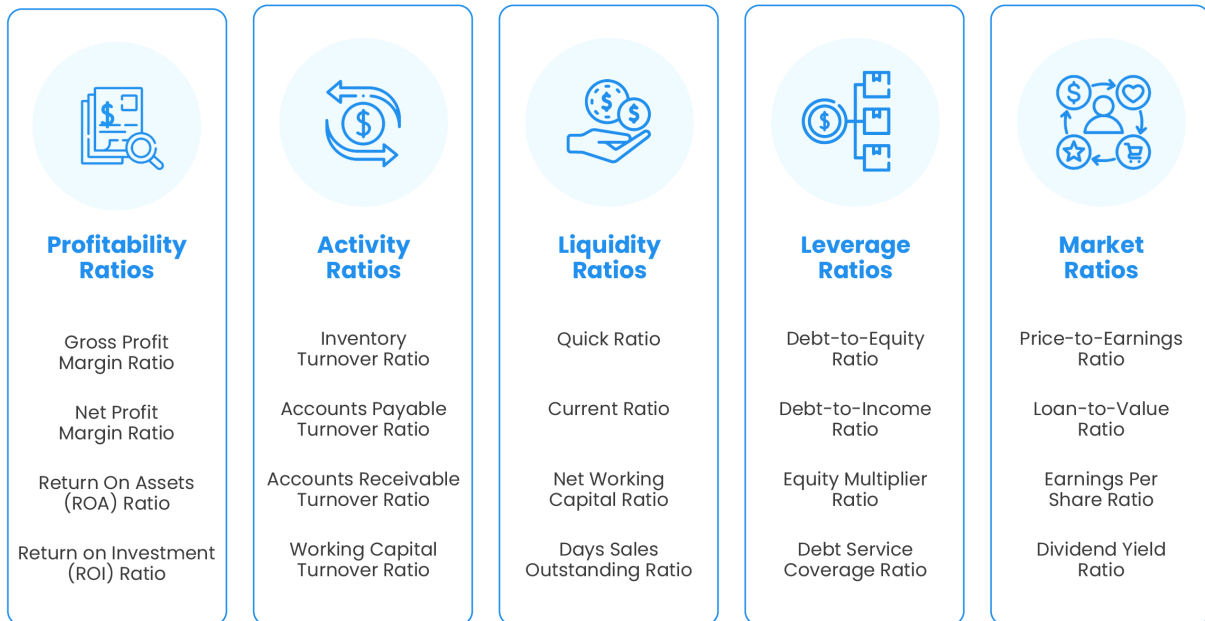

Leverage ratios, also known as solvency ratios, measure a company's ability to pay long-term debt and interest. Leverage ratios are often used by banks and financial institutions, along with potential investors.

The debt-to-equity ratio, debt-to-income ratio, debt service coverage ratio, and equity multiplier ratio are all leverage ratios.

▪ Market Ratios

Popular with current and potential investors, market ratios look at stock performance and are usually used to predict stock performance and future earnings. Price-to-earnings ratio and a loan-to-value ratio are both market ratios.

Common Accounting Ratio Categories

Top 10 Ratios and What the Results Mean

While there are hundreds of ratios that you can run that measure everything from working capital to total debt, we highlighted ten of the most frequently calculated ratios.

1. Gross Profit Margin Ratio

Calculating your gross profit margin ratio is easy and is especially useful for businesses that sell products. A profitability ratio, the gross profit margin shows you how efficiently product sales are managed, and more importantly, how much money is left over to cover operating expenses.

To calculate the gross profit margin ratio, you'll need your total revenue and cost of goods sold for the period you're calculating the ratio for. Both numbers can be obtained from your income statement.

$$\text{Gross Profit Margin Ratio} = (\text{Total Revenue} - \text{Cost of Goods Sold}) / \text{Total Revenue}$$

Gross Profit Margin Ratio Formula

$$\text{Gross Profit Margin} = \frac{\text{Total Revenue} - \text{Cost of Goods Sold}}{\text{Total Revenue}}$$

For example, if your total revenue for 2021 was \$6,200,000 while your cost of goods sold was \$3,100,000, your ratio calculation would look like this:

$$(\$6,200,000 - \$3,100,000) / \$6,200,000 = 0.50 \text{ or } 50\%$$

This result means that you earn \$.50 for each dollar of net sales. Though like any ratio, totals vary from industry to industry, anything less than 5% is considered a low gross profit margin, while anything over 20% is considered good.

For example, HP Inc. has a gross profit margin ratio of 19.8 as of 7-31-2022, which is down from its previous quarter, where the profit margin was 20.2.

Because the gross profit margin is tracked quarterly, they can see that they are trending up from their 5-year low, when the gross profit margin was 18.2% in October of 2018.

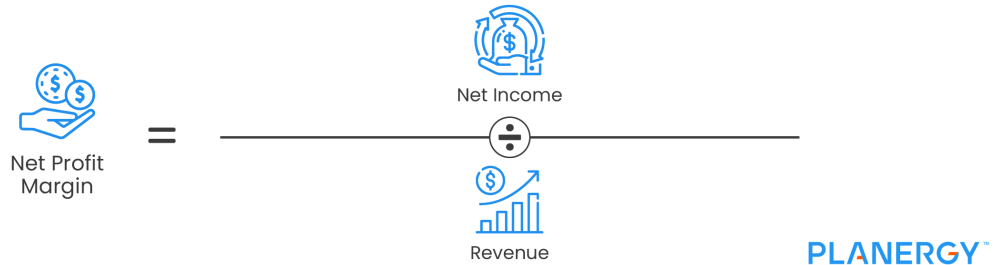

2. Net Profit Margin Ratio

Net profit margin builds off of your gross profit margin ratio by measuring your total revenue that remains after operating expenses have been paid. A profitability ratio, to calculate the net profit margin ratio, you'll need

your total revenue and total expenses, which can be found on your income statement.

Net Profit Margin Ratio = Net Income / Revenue

Net Profit Margin Ratio Formula

$$\text{Net Profit Margin} = \frac{\text{Net Income}}{\text{Revenue}}$$

For example, if your business earned \$1,100,000 in revenue and had \$610,000 in expenses for the year, you would calculate your net profit margin ratio as follows:

$(\$1,100,000 - \$610,000) / \$1,100,000 = 0.44$ or 44%

This means after all expenses are paid, your business is earning \$.44 for each dollar in revenue. Generally speaking, a net profit margin of 25% or higher is considered good, although this will vary by industry.

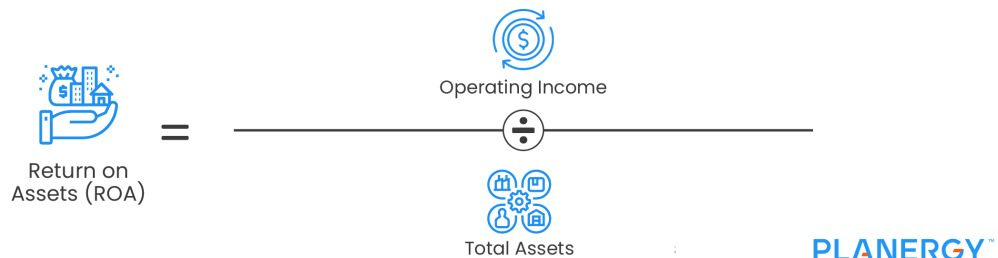

3. Return on Assets (ROA) Ratio

As a business owner, you know that assets should be used to increase profits. A profitability ratio, the return on assets ratio allows you to see just how well your company uses your assets to increase profits.

You'll need your net income from an income statement and your total assets from a balance sheet to calculate the return on assets ratio.

Return on Assets Ratio = Operating Income / Total Assets

Return on Assets (ROA) Ratio Formula

$$\text{Return on Assets (ROA)} = \frac{\text{Operating Income}}{\text{Total Assets}}$$

For this example, let's say that you have a net income of \$750,000 and total assets of \$5,100,000. Your calculation would be:

$$\text{\$750,000} / \text{\$5,100,000} = \text{0.14\% or 14\%}$$

This means that for every dollar invested in assets, you've earned \$.14.

Generally, an ROA of 5% is considered good, while one over 20% is considered excellent. However, to get a better idea of company performance, it's best to compare your results with those of similar companies.

For example, In January of 2022, Target posted an ROA of 13.2%, up from a 5-year low in 2019 of 7.2%. In comparison, Walmart's ROA for the same time frame was 5.8%, while Costco's was 9.6%. This information helps businesses see how their ROA measures against the competition in their own sector.

4. Return on Investment (ROI) Ratio

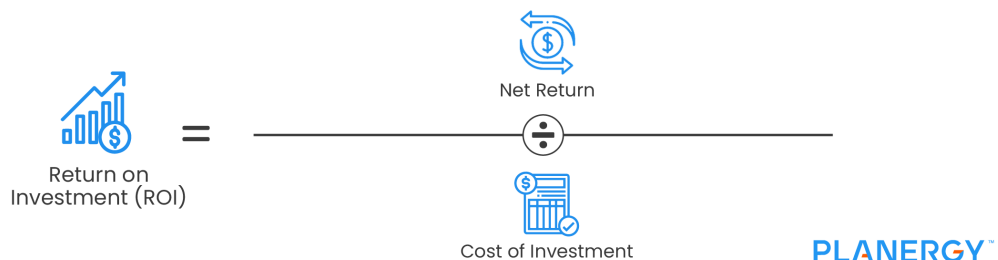

Particularly useful for startups, the return on investment or ROI ratio is a profitability ratio that gives you a look at how much in profits your

original investment has generated.

You'll need to obtain your total earnings from your income statement and the total of your initial investment from your balance sheet.

Return on Investment Ratio = Net Return / Cost of Investment

Return on Investment (ROI) Ratio Formula

$$\text{Return on Investment (ROI)} = \frac{\text{Net Return}}{\text{Cost of Investment}}$$

For example, you recently ran an aggressive advertising campaign for a new product. The cost of the campaign was \$35,000. At the end of the campaign, sales for the new product totaled \$280,000, you would calculate your return on investment as follows:

$$(280,000 - \$35,000) / \$35,000 = 7$$

Conventional wisdom states that an ROI of 7% or more is good, while others believe that an ROI of at least 10% is needed to fund proper business growth.

A return on equity (ROE) ratio can also be calculated, which measures a company's net income divided by shareholder's equity.

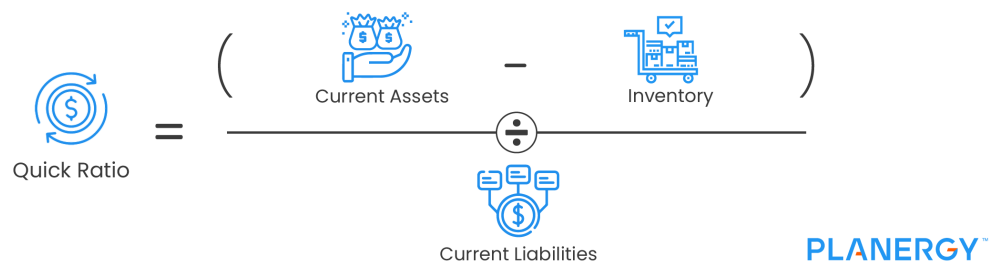

5. Quick Ratio

If you're wondering if your business is able to meet its short-term debt

obligations, you may want to calculate the quick ratio, also known as the acid test ratio. A liquidity ratio, to get started, you'll need to obtain your current liquid assets, inventory, and current liability totals, all found on your balance sheet.

$$\text{Quick Ratio} = (\text{Current Assets} - \text{Inventory}) / \text{Current Liabilities}$$

Quick Ratio Formula

The diagram illustrates the Quick Ratio Formula. On the left, a circular icon with a dollar sign and a refresh symbol is labeled 'Quick Ratio'. This is followed by an equals sign. To the right of the equals sign is a large fraction. The numerator is enclosed in parentheses and contains two items: 'Current Assets' (represented by an icon of a hand holding money) and 'Inventory' (represented by a shopping cart icon), separated by a minus sign. The denominator is 'Current Liabilities' (represented by an icon of a stack of money). A division symbol is placed between the numerator and the denominator. The PLANERGY logo is in the bottom right corner.

For example, your current assets, including accounts receivable, total \$7,500,000, with inventory of \$3,500,000 and liabilities of \$1,750,000. Using these numbers, let's calculate your quick ratio.

$$(\$7,500,000 - \$3,500,000) / \$1,750,000 = 2.28$$

This result indicates that for every dollar of liabilities your business has \$2.28 in assets. A one-to-one ratio is necessary to cover all of your liabilities, but anything more is excess cash. But be careful not to let it get too high. Some investors view a high quick ratio as a business not using its assets aggressively enough.

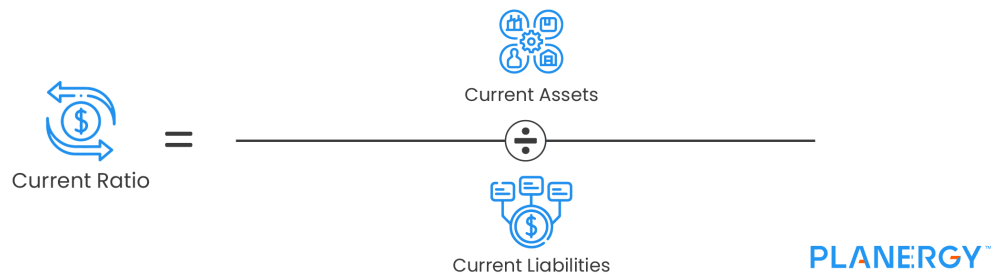

6. Current Ratio

Similar to the quick ratio, the current ratio is a liquidity ratio used to determine how well you're in position to pay off debt, including interest expense.

First, obtain your asset and liability totals from your balance sheet.

Current Ratio = Current Assets / Current Liabilities

Current Ratio Formula

Using the same totals used in the quick ratio, minus inventory, here's how you would calculate the current ratio:

\$7,500,000 / \$1,750,000 = 4.28

This means that for every dollar of liabilities, your business has \$4.28 in assets. Again, a one-to-one result is necessary, and like the quick ratio, too high of a current ratio can indicate that you're not using your assets aggressively enough.

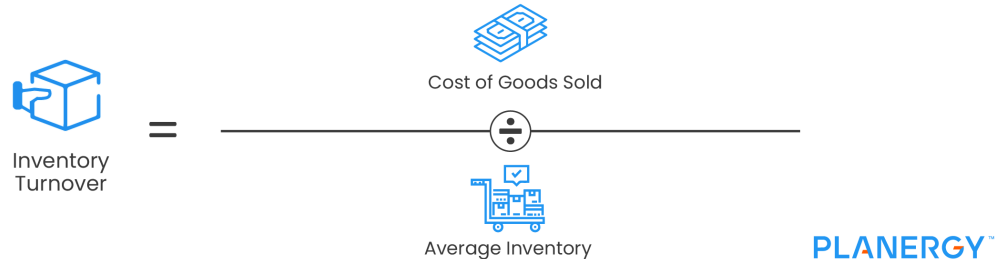

7. Inventory Turnover Ratio

If you don't carry inventory, you can skip this ratio, but for those that do, calculating the inventory turnover ratio, an activity ratio, can provide good insight into how quickly your inventory moves.

You'll need to track down a few numbers before calculating this ratio, including both beginning and ending inventory values for the period you're calculating.

Inventory Turnover Ratio = Cost of Goods Sold / Average Inventory

Inventory Turnover Ratio Formula

The diagram illustrates the formula for the Inventory Turnover Ratio. On the left, an icon of a cube with a hand pointing to it is labeled 'Inventory Turnover'. This is followed by an equals sign. To the right of the equals sign is a horizontal line with a division symbol (÷) in the center. Above the line is an icon of a stack of coins labeled 'Cost of Goods Sold'. Below the line is an icon of a shopping cart with a checkmark labeled 'Average Inventory'. The PLANERGY logo is located at the bottom right of the diagram.

For example, if your beginning inventory was \$1,600,000 and your ending inventory was \$1,800,000, your average inventory for the year would be \$1,700,000. Then find your cost of goods sold on your income statement, which for this calculation is \$6,500,000 to calculate the inventory turnover ratio.

$$\text{\$6,500,000} / \text{\$1,700,000} = 3.82$$

This result means that you sell your inventory almost 4 times annually. A good turnover ratio runs between 5% and 10%, with anything lower indicative of slow sales or an excessive amount of inventory on hand.

8. Accounts Payable Turnover Ratio

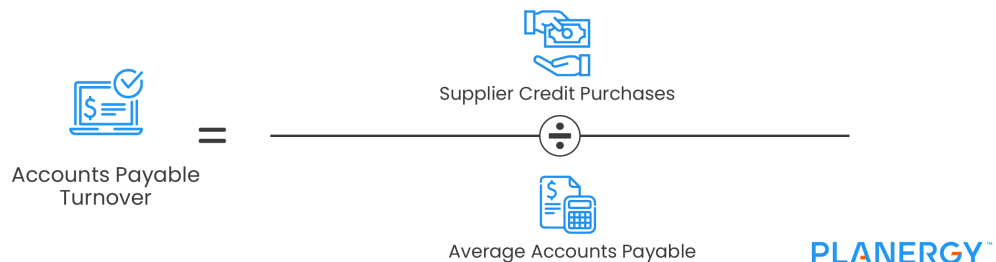

The accounts payable turnover ratio, a liquidity ratio, is used to determine a company's ability to pay vendors and suppliers during a specific period. Used to help determine a company's creditworthiness, the accounts payable turnover ratio needs to be calculated on a regular basis for it to be helpful.

The accounts payable turnover ratio requires several steps for calculation. First, you'll have to calculate your average payables balance for the

period. Next, you'll need to calculate your net purchases. Once you have these two totals, you can calculate your AP turnover ratio.

Accounts Payable Turnover Ratio = Supplier Credit Purchases / Average Accounts Payable

Accounts Payable Turnover Ratio Formula

Let's say you have a beginning AP balance of \$95,000 and an ending AP balance of \$93,000, and total purchases of \$425,000 with returns of \$15,000. Your calculations would be as follows:

$$(\$95,000 + \$93,000) / 2 = \$94,000$$

$$\$425,000 - \$15,000 = \$410,000$$

Now, you can calculate the ratio:

$$\text{\textcolor{red}{\$410,000 / \$94,000 = 4.36}}$$

This means that in 2021, your business paid your accounts payable balances 4.36 times throughout the year.

With the accounts payable turnover ratio, a higher number is usually better, since a higher number means you're paying your AP balances more frequently, though too high of a number can also mean that credit circumstances are forcing you to pay your bills early.

If your AP turnover ratio is consistently low, you may want to consider using a procure-to-pay software like PLANERGY, that can streamline the entire AP process from purchase order to invoice payment.

9. Accounts Receivable Turnover Ratio

Like the accounts payable turnover ratio, the accounts receivable turnover ratio should be calculated regularly. This activity ratio measures how quickly you're collecting outstanding balances from your credit customers.

To calculate your AR turnover ratio, you'll need to obtain your total credit sales for the time period in question, excluding cash sales in your total.

You'll then need to obtain your beginning and ending accounts receivable balances for that same period.

Accounts Receivable Turnover Ratio = Net Credit Sales / Average Accounts Receivable

Accounts Receivable Turnover Ratio Formula

$$\begin{array}{c} \text{Accounts} \\ \text{Receivable Turnover} \end{array} = \frac{\begin{array}{c} \text{Net Credit Sales} \end{array}}{\begin{array}{c} \text{Average Accounts Receivable} \end{array}}$$

PLANERGY™

Let's say for 2021, your business had total sales in the amount of \$1,200,000, with \$10,000 of that cash sales. Next, your beginning AR balance as of January 1 is \$474,000 with an ending balance as of December 31 of \$470,000. These are your calculations:

$$\$1,200,000 - \$10,000 = \$1,190,000$$

$$\$274,000 + \$270,000 / 2 = \$272,000$$

With this information, you can calculate your AR turnover ratio:

$$\text{\textcolor{red}{\$1,190,000 / \$272,000 = 4.37}}$$

This indicates that you collect your AR balances around four times a year.

The higher your accounts receivable turnover ratio, the quicker you're getting paid by your credit customers. Of course, too high of a number can also indicate that you're only offering limited credit terms to your very best customers.

10. **Debt-to-Equity Ratio**

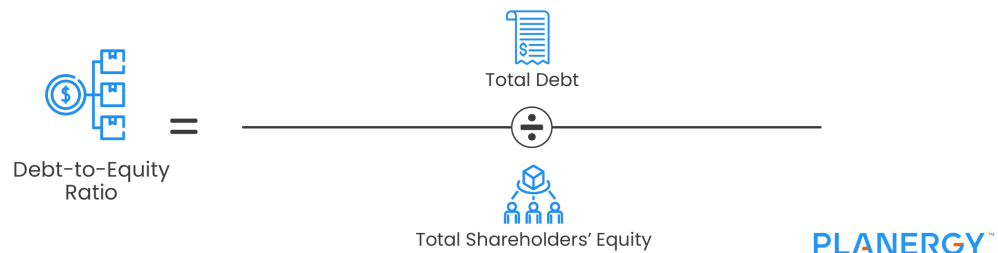

Also known as a debt-to-asset ratio, the debt-to-equity ratio is a leverage ratio that looks at your current level of debt compared to your total assets to determine financial leverage.

This debt ratio is used to help determine how much of your assets are financed from loans compared to owner equity. The debt-to-equity ratio is popular with those looking to invest in a company since it tells them how well a company can cover its current amount of debt.

You can calculate this ratio by obtaining total liabilities and total shareholder's equity, with both numbers found on your balance sheet.

$$\text{\textcolor{red}{Debt-to-Equity Ratio = Total Debt / Total Shareholders' Equity}}$$

Debt-to-Equity Ratio Formula

The diagram illustrates the Debt-to-Equity Ratio Formula. On the left, the text "Debt-to-Equity Ratio" is accompanied by an icon of a stack of three blue cubes with a dollar sign on the top cube. This is followed by an equals sign. To the right of the equals sign is a horizontal line representing a fraction. Above the line is the text "Total Debt" with an icon of a document with a dollar sign. Below the line is the text "Total Shareholders' Equity" with an icon of three blue cubes. The PLANERGY logo is located in the bottom right corner of the diagram.

$$\text{Debt-to-Equity Ratio} = \frac{\text{Total Debt}}{\text{Total Shareholders' Equity}}$$

For example, if your business currently has total liabilities of \$1,400,000 and total shareholder's equity of \$ 2,100,000 you would calculate the debt-to-equity ratio as follows:

$$\text{\$1,400,000} / \text{\$2,100,000} = 0.67$$

This result means that for every dollar of equity your business has, it currently has \$0.67 in debt. Though a good debt-to-equity ratio can vary from industry to industry, anything less than 1 is considered good, while a debt-to-equity ratio higher than 2 signals that your company is highly leveraged and a riskier investment.

How to Use Accounting Ratios in Your Business

Accounting or financial ratios can be extremely useful for businesses, provided that the proper ratio analysis is completed. A ratio calculated only once provides a good snapshot into your business finances but provides little in the way of useful detail if they're not calculated regularly.

What's your goal today?

1. Use PLANERGY to manage purchasing and accounts payable

We've helped save billions of dollars for our clients through better spend management, process automation in purchasing and finance, and reducing financial risks. To discover how we can help grow your business:

- Read our case studies, client success stories, and testimonials.
- Visit our Accounts Payable Automation Software page to see how PLANERGY can automate your AP process reducing you the hours of manual processing, stopping erroneous payments, and driving value across your organization.
- Learn about us, and our long history of helping companies just like yours.
